

長期成本

$$L^*(Q, \overset{w_L}{Q}, \overset{w_K}{Q}).$$

$$K^*(Q, \overset{w_L}{Q}, \overset{w_K}{Q}).$$

$$TC = w_L L^*(Q, w_L, w_K) + w_K K^*(Q, w_L, w_K)$$

$$\begin{cases} \frac{w_L}{f_L(L^*, K^*)} = \frac{w_K}{f_K(L^*, K^*)} \\ f(L^*, K^*) = Q \end{cases} \quad \begin{matrix} \text{MC} \\ = MC \end{matrix}$$

Long run

$$MC = w_L \frac{dL^*(Q)}{dQ} + w_K \frac{dK^*(Q)}{dQ}$$

$$\begin{cases} f_L \frac{dL^*}{dQ} + f_K \frac{dK^*}{dQ} = 1 \\ \frac{dK^*}{dQ} = \frac{1 - f_L \frac{dL^*}{dQ}}{f_K} \end{cases}$$

$$\begin{cases} c = w_L L^0 \\ f(L^0, K^0) = Q \\ f_L dL^0 = dQ \\ \frac{dL}{dQ} = \frac{1}{f_L} \end{cases}$$

$$\frac{dc}{dQ} = w_L \frac{dL}{dQ} = \frac{w_L}{f_L} = MC$$

L.R.

$$\begin{cases} \min w_L L + w_K K \\ s.t. f(L, K) = Q \end{cases}$$

$$= w_L \frac{dL^*}{dQ} + \frac{w_K}{f_K} - \frac{w_K f_L}{f_K} \cdot \frac{dL^*}{dQ}$$

$$w_L L + w_K K + \lambda [Q - f(L, K)]$$

$$= (w_L - \frac{w_K f_L}{f_K}) \frac{dL^*}{dQ} + \frac{w_K}{f_K}$$

$$= \frac{w_K}{f_K} = \frac{w_L}{f_L} = \lambda$$

short run MC

短期成本(短)

短期平均成本 $LAC = \frac{w_L L^*(Q) + w_K K^*(Q)}{f(L^*(Q), K^*(Q))}$

$$\frac{dLAC}{dQ} = \frac{w_L \frac{dL^*}{dQ} + w_K \frac{dK^*}{dQ}}{f} - \frac{w_L L^* + w_K K^*}{f^2}$$

$$= \frac{MC}{f} - \frac{TC}{f^2} \left(= \frac{MC \cdot Q - TC}{Q^2} \right) = \frac{1}{Q} (MC - AC)$$

(当AC上升时 MC > AC)
(当AC下降时 MC < AC)

短期平均成本

前述 $c = w_L L^0$ 为 K 固定在 \bar{K} 时的短期成本, 故短期成本

$$AVC = \frac{w_L L^0}{f(L^0, \bar{K})} \quad \text{且 } F = w_K \bar{K} \text{ 为固定成本}$$

⑤ 含固定成本的短期总成本 $F + w_L L^0 = w_L L^0 + w_K \bar{K}$
短期平均总成本为:

$$\frac{F + w_L L^0}{f(L^0, \bar{K})} \equiv SAC$$

$$\frac{dSAC}{dQ} = \frac{d}{dQ} \frac{w_L L^0 + w_K \bar{K}}{f(L^0, \bar{K})} = \frac{w_L \frac{dL^0}{dQ}}{f} - \frac{w_L L^0 + w_K \bar{K}}{f^2}$$

因 \bar{K} 为常数.

$$= \frac{w_L / f_L}{f} - \frac{w_L L^0 + w_K \bar{K}}{f^2} = \frac{w_L}{f} \left(\frac{1}{f_L} - \frac{L^0}{f} \right) - \frac{w_K \bar{K}}{f^2}$$

$$\frac{dLAC}{dQ}$$

当 $\bar{K} = K^*$ 时
